### ANSI/NEMA FL 1 STANDARDS

The American National Standards Institute (ANSI) with input from the light industry, have developed performance standards and symbols to effectively communicate a light's features and benefits. The organisation coordinates US standards with international standards so American products can be used globally.

#### Light Output

Light Output is the total luminous flux. It is the total quantity of emitted overall light energy as measured by integrating the entire angular output of the portable light source. Light output in this standard is expressed in units of lumens.

#### Run Time

Run Time is defined as the duration of time from the initial light output value after the point the device is first turned on – using fresh batteries, until the light output reaches 10% of the initial value.

#### Peak Beam Intensity

Peak Beam Intensity is the maximum luminous intensity typically along the central axis of a cone of light. The value is reported in candela and does not change with distance.

#### Beam Distance

Beam Distance is defined as the distance from the device at which the light beam is 0.25 lux (0.25 lux is approximately the equivalent of the light emitted from the full moon "on a clear night in an open field").

### KEY FEATURES
